

Semester Project 2

Student Name

Martin Lian Krane

Design

What went well on the project

I think the overall design went well and most of the responsive parts of the project aswell. I liked how my hero section turned out and the product cards. I had 4 fonts used, but I think I should have found some that was more different than each other for this. I paired two and two using Google too check what fit well together.

I designed it desktop first(27 inch screen) because I know that the target audience for this is almost always on a desktop so I prioritized making it look big for big screen.

What was difficult/didn't go well on the project

The product details part was a bit hard to do because World of Warcraft have so many options you would have to have before adding a product to cart. I ended up with just doing the same for all of them, with just the basic ones.

I struggled a bit to find something more to fill the Home page to not make it too boring.

There are a few minor tweaks I didn't get the time to do like making the mobile menu better and some small issues in the footer etc.

What would you do differently next time

As always I would have liked to design it better on Adobe or Figma but I still find it hard when you don't really have a plan, so I always end up by just going with it as I code the site.

Technical

What went well on the project

I think most of the technical went good except admin section. The login was not so hard to do, all the Strapi API calls went good. Splitting the code up went pretty good but there were a few functions etc. I could have split up as well to make better. For example my add to cart buttons I have the same on the Cart js and the Admin js.

Note:

I made two function to redirect to login page if the jwt key is not found in local storage, I have commented out these so its easier to navigate for review.

What was difficult/didn't go well on the project

The admin section was very difficult for me, while writing this I have only managed to make the form that makes a product but without a toggle for

featuring it. I'm still trying to make the update one work without any luck, when I click edit on my product it takes me to the form but it doesn't fill out the fields with its data.

I spent a lot of time in the start to render the images from the strapi to the html.

I also had to make to seperate async functions for the hero section and the featured products because I couldn't find a way to filter it all in one async.

What would you do differently next time

Just get better with Javascript.

I would have the images on the cards another way, I decided to use background images on them, mainly because I struggled rendering the images from the API. But also because it's easier to style in my opinion. The only issue this made is when I'm filtering products in the search bar the images gets messed up a bit.

Maybe not have a seperate login screen, and have it pop up on admin page instead.

Note: I don't have word premium so had to copy everything to onedrive in browser. Sorry for this :D
